With regard to aircraft, the turboshaft engine is a gas turbine engine made to transfer horsepower to a shaft that turns a helicopter transmission or is an onboard auxiliary power unit (APU). An APU is used on turbine-powered aircraft to provide electrical power and bleed air on the ground and a backup generator in flight.

Aircraft Gas Turbine Engines Types and Construction ...

An aircraft engine, often referred to as an aero engine, is the power component of an aircraft propulsion system. Most aircraft engines are either piston engines or gas turbines, although in recent years many small UAVs have used electric motors.

Aircraft engine - Wikipedia

Gas-turbine engine, any internal- combustion engine employing a gas as the working fluid used to turn a turbine. The term also is conventionally used to describe a complete internal-combustion engine consisting of at least a compressor, a combustion chamber, and a turbine.

Aircraft Gas Turbine Engine Technology

Aircraft Gas Turbine Engine Technology Turbojet engines were the first type of gas turbine engine invented. And even though they look completely different than the reciprocating engine in your car or plane, they operate using the same theory: intake, compression, power, exhaust. How Does A Turbojet Work?

How The 4 Types Of Turbine Engines Work | Boldmethod

Combustion Section of Aircraft Gas Turbine Engine The combustion section houses the combustion process, which raises the temperature of the air passing through the engine. This process releases energy contained in the air/ fuel mixture. The major part of this energy is required at the turbine or turbine stages to drive the compressor.

Combustion Section of Aircraft Gas Turbine Engine ...

The turbine that drives the compressor has two stages, with the first stage using single-crystal blades. A free power turbine with two stages drives the propeller through an inner shaft and a gearbox.: 83–84 The engine has replaceable steel blades and vanes, which are more reliable but heavier than titanium.

Before the engine can be returned to service, the preservative oil must be completely flushed from the fuel system by motoring the engine and bleeding the fuel system. Always follow the manufacturer's instructions when performing any preservation or depreservation of gas turbine engines.

Preservation and Depreservation of Gas Turbine Engines ...

All commercial aircraft designed in the last 40 years (other than aircraft with fewer than a dozen passengers) are powered by gas turbine engines, either turbofan or turboprop. Thus, any discussion of reducing carbon emissions from commercial aircraft will need to consider the potential for improvement of gas turbine engines.
